Appendix Figure A1. Dose-response to determine IC50 in parental (P) and resistant (R) tumor cell lines (A-C).

Appendix Figure A2. The metabolic profiling of P and R cell lines was conducted. Bioenergetic function was evaluated using the Seahorse XF24 Analyzer. A representative profile shows the Oxygen Consumption Rate (OCR) (A) and Extracellular Acidification Rate (ECAR) (B) of P- and R-HCT cells, recorded at baseline and following the injection of oligomycin (an ATP synthase inhibitor), FCCP (an uncoupler), rotenone (a complex I inhibitor), antimycin A (a complex III inhibitor), and 2-deoxy glucose (2DG). Each data point represents the mean \pm SEM of three technical replicates (n=3). The data, normalized to protein content for Rot+AA-sensitive OCR and 2DG-sensitive ECAR, represent the mean \pm SEM of four independent experiments, each with three technical replicates. Representative OCR (C) and ECAR (D) traces are displayed for Huh7 P and R, showing the mean \pm SEM of four independent biological replicates, each with three technical replicates (n=4).

Appendix Figure A3. Adding 100 mM L-lactate to the “respiration buffer” used for oxygraphy measurements does not change the pH (A) or osmolarity (B).

Appendix Figure A4. The effect of osmolarity, specifically sucrose, on cellular respiration. The effect of osmolarity on cellular respiration has been tested by repeated additions of 25 mM sucrose, which corresponds to an osmolarity of 25 mOsm. A: Huh7, B: HCT-116, C: MDA-MB-231. Data represents the average of three independent biological replicates (n = 3) with three technical replicates each.

Appendix Figure A5. The effect of L-lactate addition on oxidative and glycolytic function in HCT-116 and Huh7 cells is shown. Bar graphs show basal OCR and basal OCR after the addition of Oligomycin (Oligo) and FCCP in HCT-116 P and R (A) and Huh7 P and R (B). Data represents the average \pm SEM of three biological replicates (n=3), each with two technical replicates. ** p<0.01, *** p<0.001, **** p<0.0001.

Appendix Figure A6. Tables summarizing the newly synthesized chemical compounds tested in the study.

Appendix Figure A7. A: Lignan-based structure of compounds tested in the study. B: Improvement of OXPHOS efficiency in HK-treated cells for 24 h.

Appendix Figure A8. The effect of chemotherapy drugs, toolkit (TK), and its components on parental (P) cell lines is shown. The figure shows the effects of the drugs, TK, its components (2 μ M GNE-140 and 10 μ M Honokiol), and the combination of the chemotherapy drug + TK in Huh7 P (A), HCT-116 P (B), MDA-MB-231 P (C), HLE-neo (D), and HepG2 shRNA LPAR6 (E). Data represents the average \pm SEM of three biological replicates (n=3), each with two technical replicates. ** p<0.01, *** p<0.001, **** p<0.0001.

Table A1. Newly synthesized chemical compounds tested in the study

Identification label (trivial name)	FW formula	Structure
XET 2-benzyl-6-(4-bromophenyl)imidazo[2,1-b][1,3,4]thiadiazol-5-yl thiocyanate	427,34 C ₁₈ H ₁₁ BrN ₄ S ₂	
XBF 2-benzyl-6-(4-fluorophenyl)imidazo[2,1-b][1,3,4]thiadiazole-5-carbaldehyde	337,37 C ₁₈ H ₁₂ FN ₃ OS	
SKS-106 6-(4-methoxyphenyl)-2-[(4-methylphenyl)methyl]imidazo[2,1-b][1,3,4]thiadiazole-5-carbaldehyde	463,19 C ₂₀ H ₁₇ N ₃ O ₂ S	
SKS-194 5-bromo-6-(4-bromophenyl)-2-[(4-methylphenyl)methyl]imidazo[2,1-b][1,3,4]thiadiazole	404,08 C ₁₈ H ₁₃ Br ₂ N ₃ S	
SKS-63 (3E)-3-({2-[(4-chlorophenyl)methyl]-6-phenylimidazo[2,1-b][1,3,4]thiadiazol-5-yl)methylidene}-1,3-dihydro-2H-indol-2-one	468,96 C ₂₆ H ₁₇ ClN ₄ OS	
SCR-7(P) [5,6-bis(benzylideneamino)-2-mercapto-pyrimidin-4-ol]	336,41 C ₁₈ H ₁₆ N ₄ OS	

Identification label (trivial name)	FW formula	Structure
55-28 (E)-1,2,3-trimethoxy-5-(4-methylstyryl)benzene	284,35 C ₁₈ H ₂₀ O ₃	
SKS-155 (3Z)-3-[2-(5-chloro-6-oxo-1,6-dihydropyridazin-4-yl)hydrazinylidene]-1,3-dihydro-2H-indol-2-one	289,68 C ₁₂ H ₈ ClN ₅ O ₂	
SKS-159 (3Z)-5-chloro-3-[2-(5-chloro-6-oxo-1,6-dihydropyridazin-4-yl)hydrazinylidene]-1,3-dihydro-2H-indol-2-one	324,12 C ₁₂ H ₇ Cl ₂ N ₅ O ₂	
AD-05	422,48 C ₂₆ H ₂₂ N ₄ O ₂	
AD-22	436,51 C ₂₇ H ₂₄ N ₄ O ₂
